

What is Minimally invasive glaucoma Surgery (MIGS)?

As suggested by the name, MIGS is a minimally invasive glaucoma operation that offers both high levels of safety as well as rapid recovery compared to traditional glaucoma operations. MIGS has developed over the past decade and Mr Ratnarajan has pioneered many of these treatments in the UK. He is able to offer an unparalleled range of these surgeries, some of which are listed below. MIGS can be performed alongside cataract surgery or as a standalone operation.

MIGS is designed to control glaucoma by lowering the pressure in the eye. It can achieve this by improving the outflow of fluid from the eye or by reducing the fluid production.

Some of the MIGS that Mr Ratnarajan can offer include:

- iStent
- Endoscopic Cyclophotocoagulation
- Preserflo Microshunt
- Hydrus Microstent
- Xen implant

If you are interested to see if you are suitable for MIGS please contact Mr Ratnarajan's office on:
